Raffles Girls' School (Secondary)

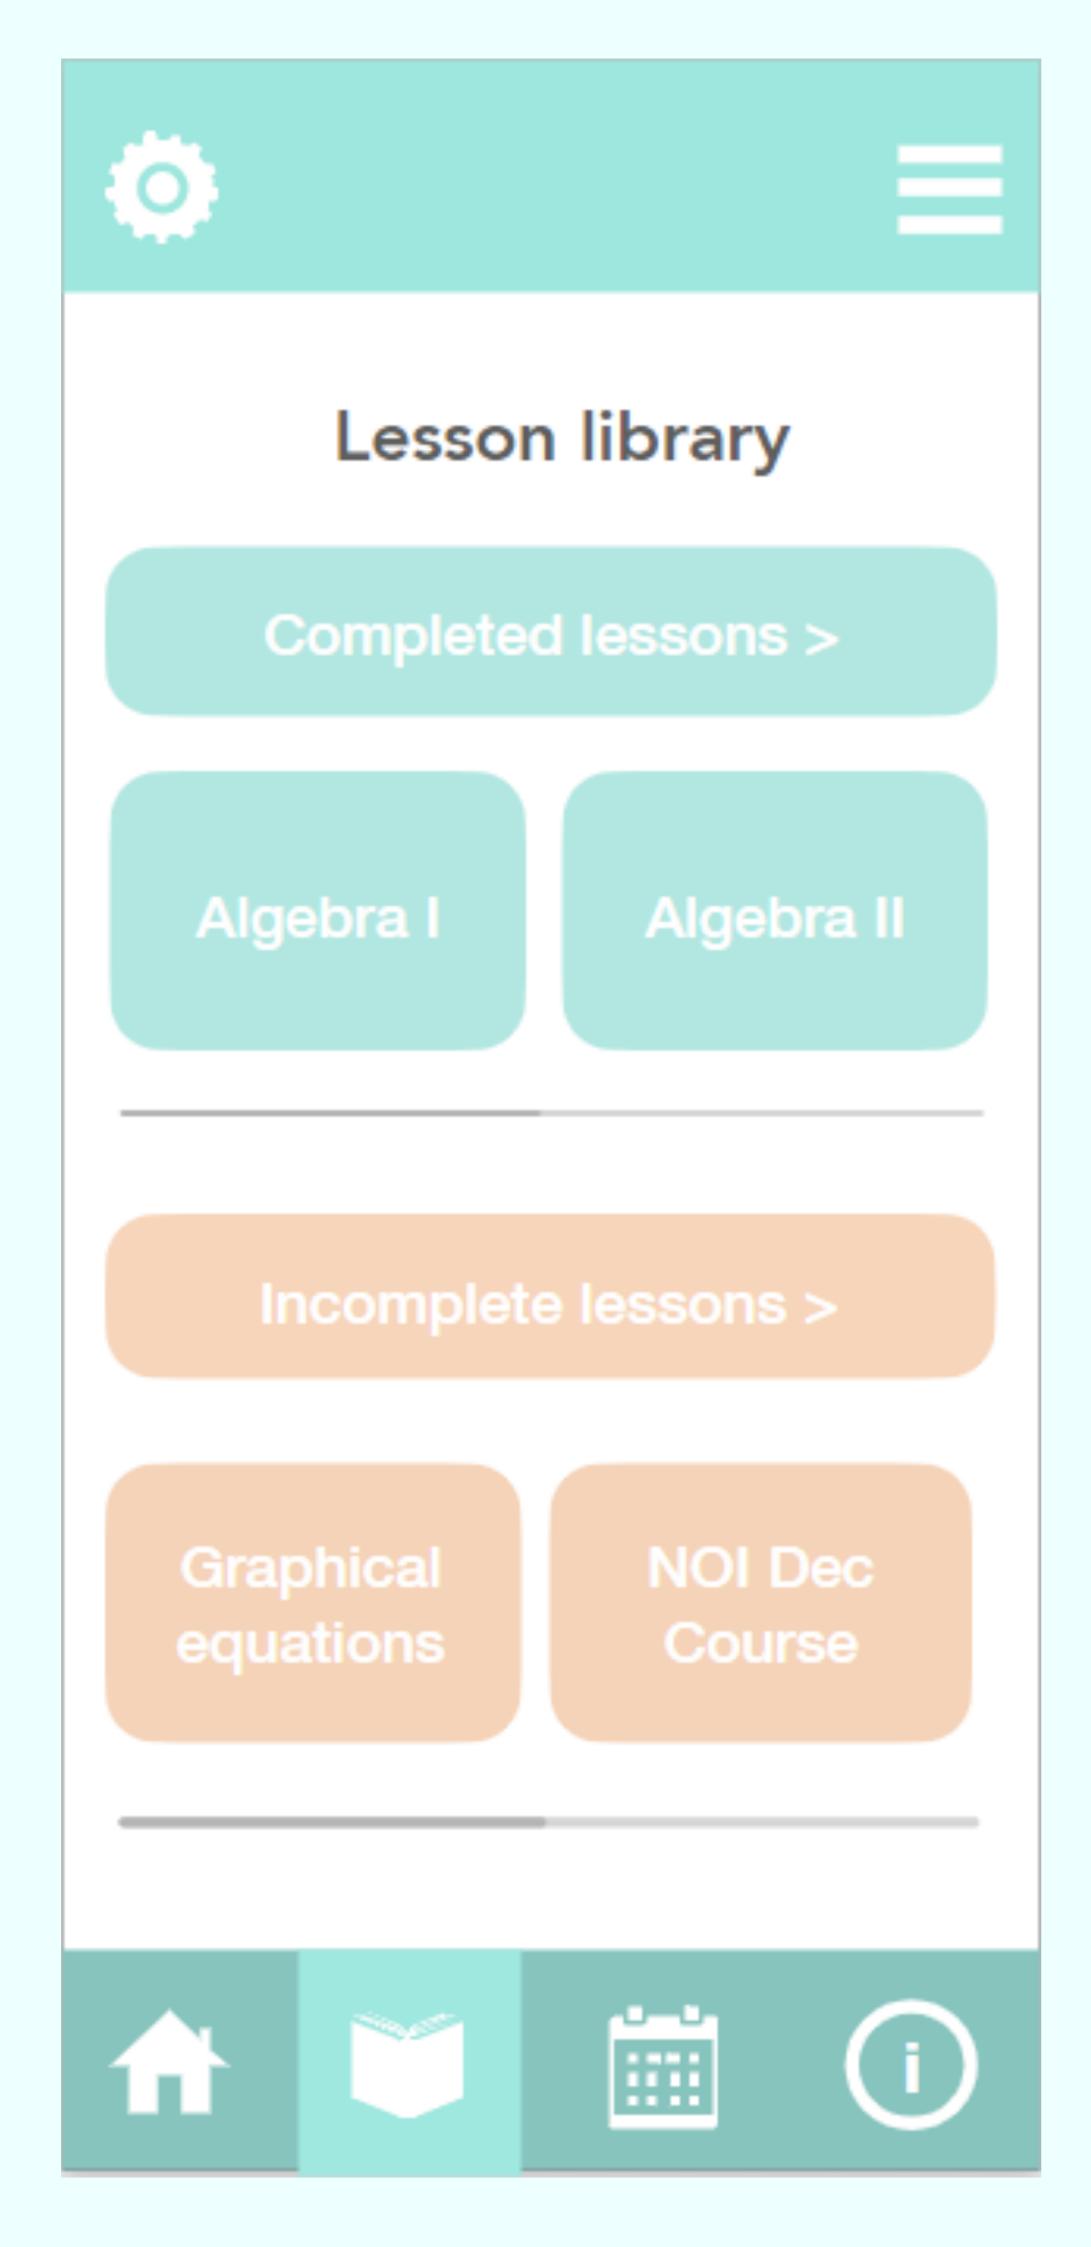

There are many learning apps out there for students. However, with these ordinary classroom apps, students with ADHD may not be able to concentrate on the lessons, rendering them less effective.

Magnum focus aims to provide online learning resources that help students with ADHD improve in their academics by providing them a way to improve their focus, while also entertaining them.

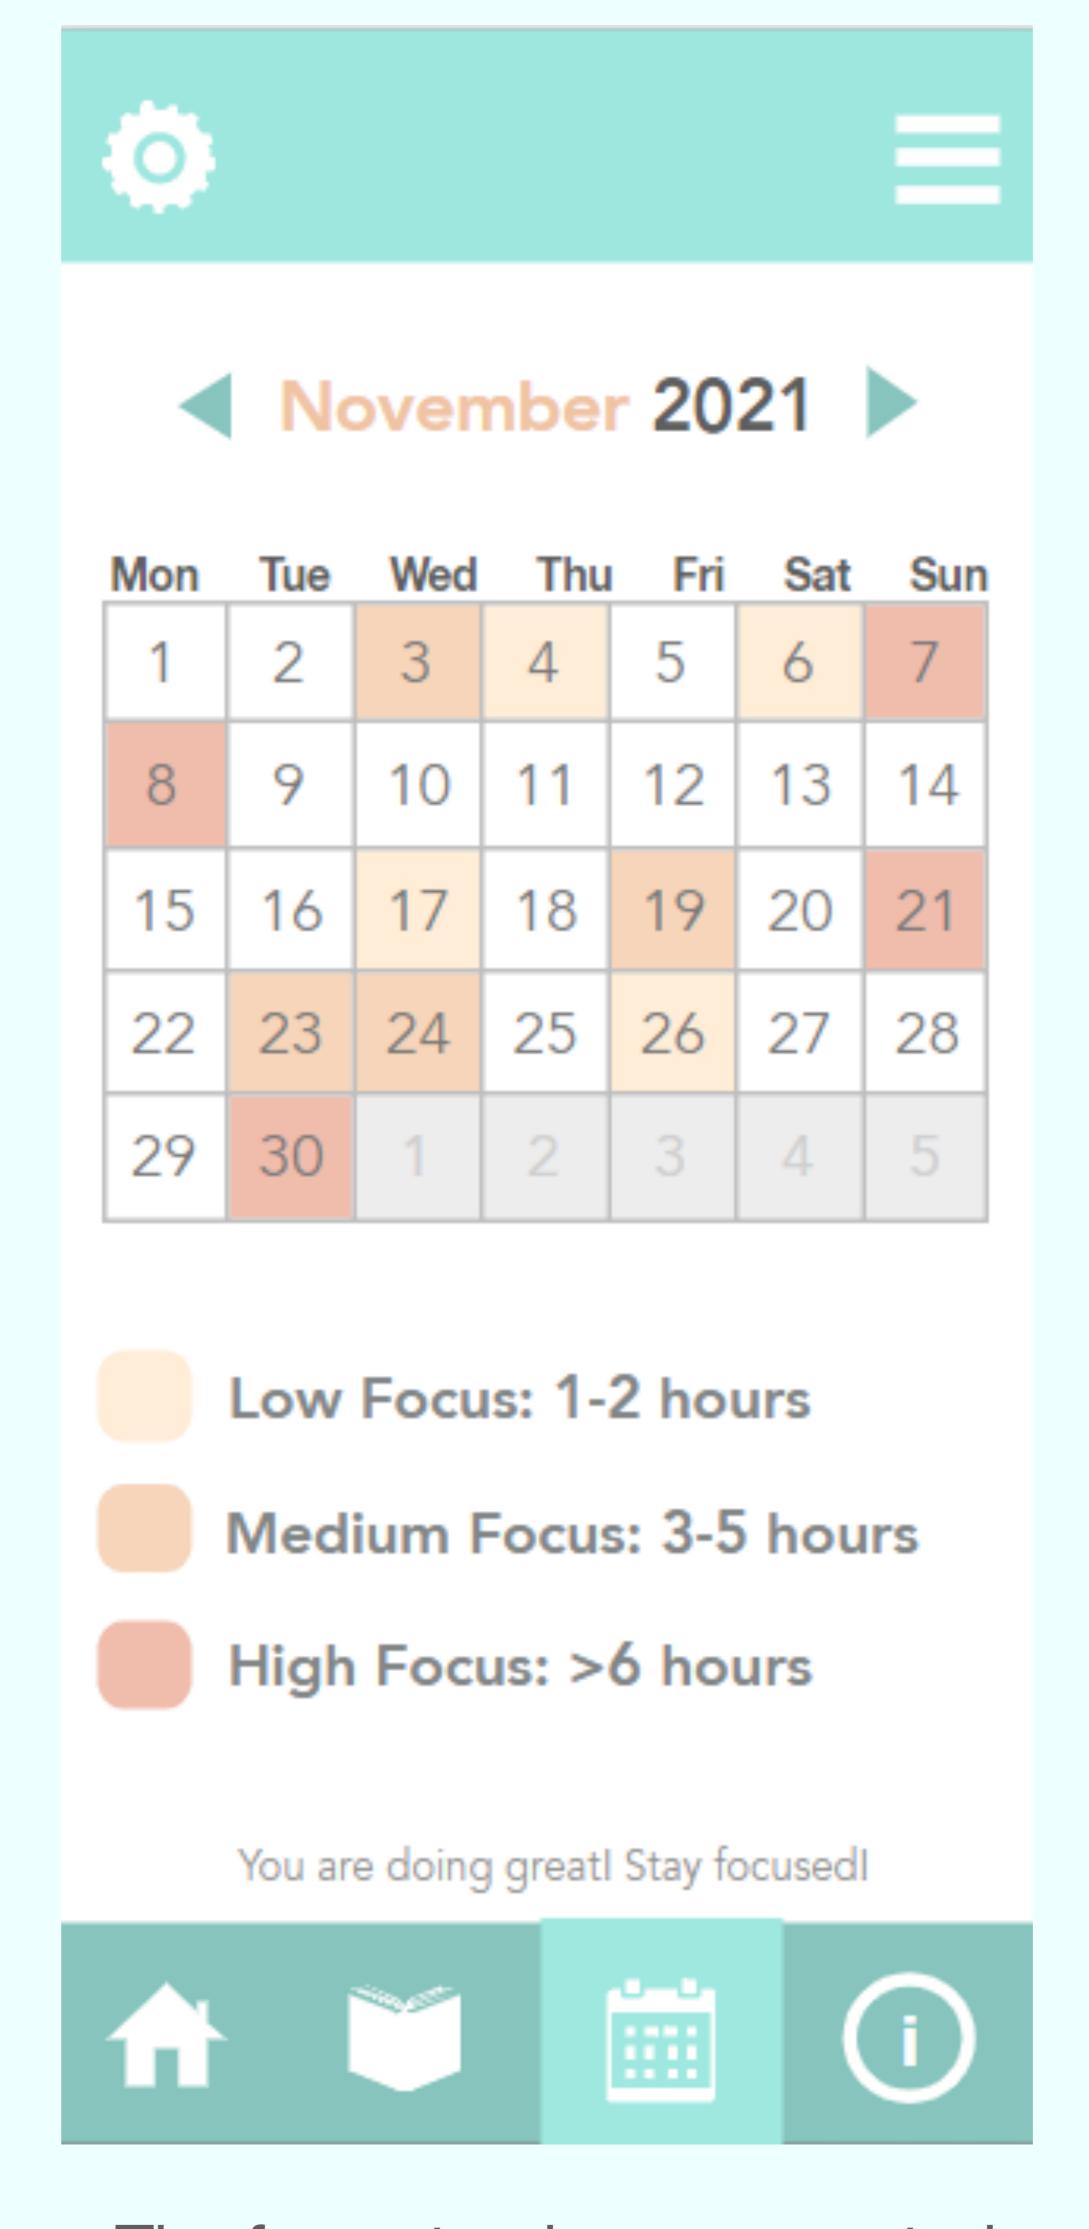

Our app idea also includes an interface for parents and teachers, where they can track their child's progress and find more resources.

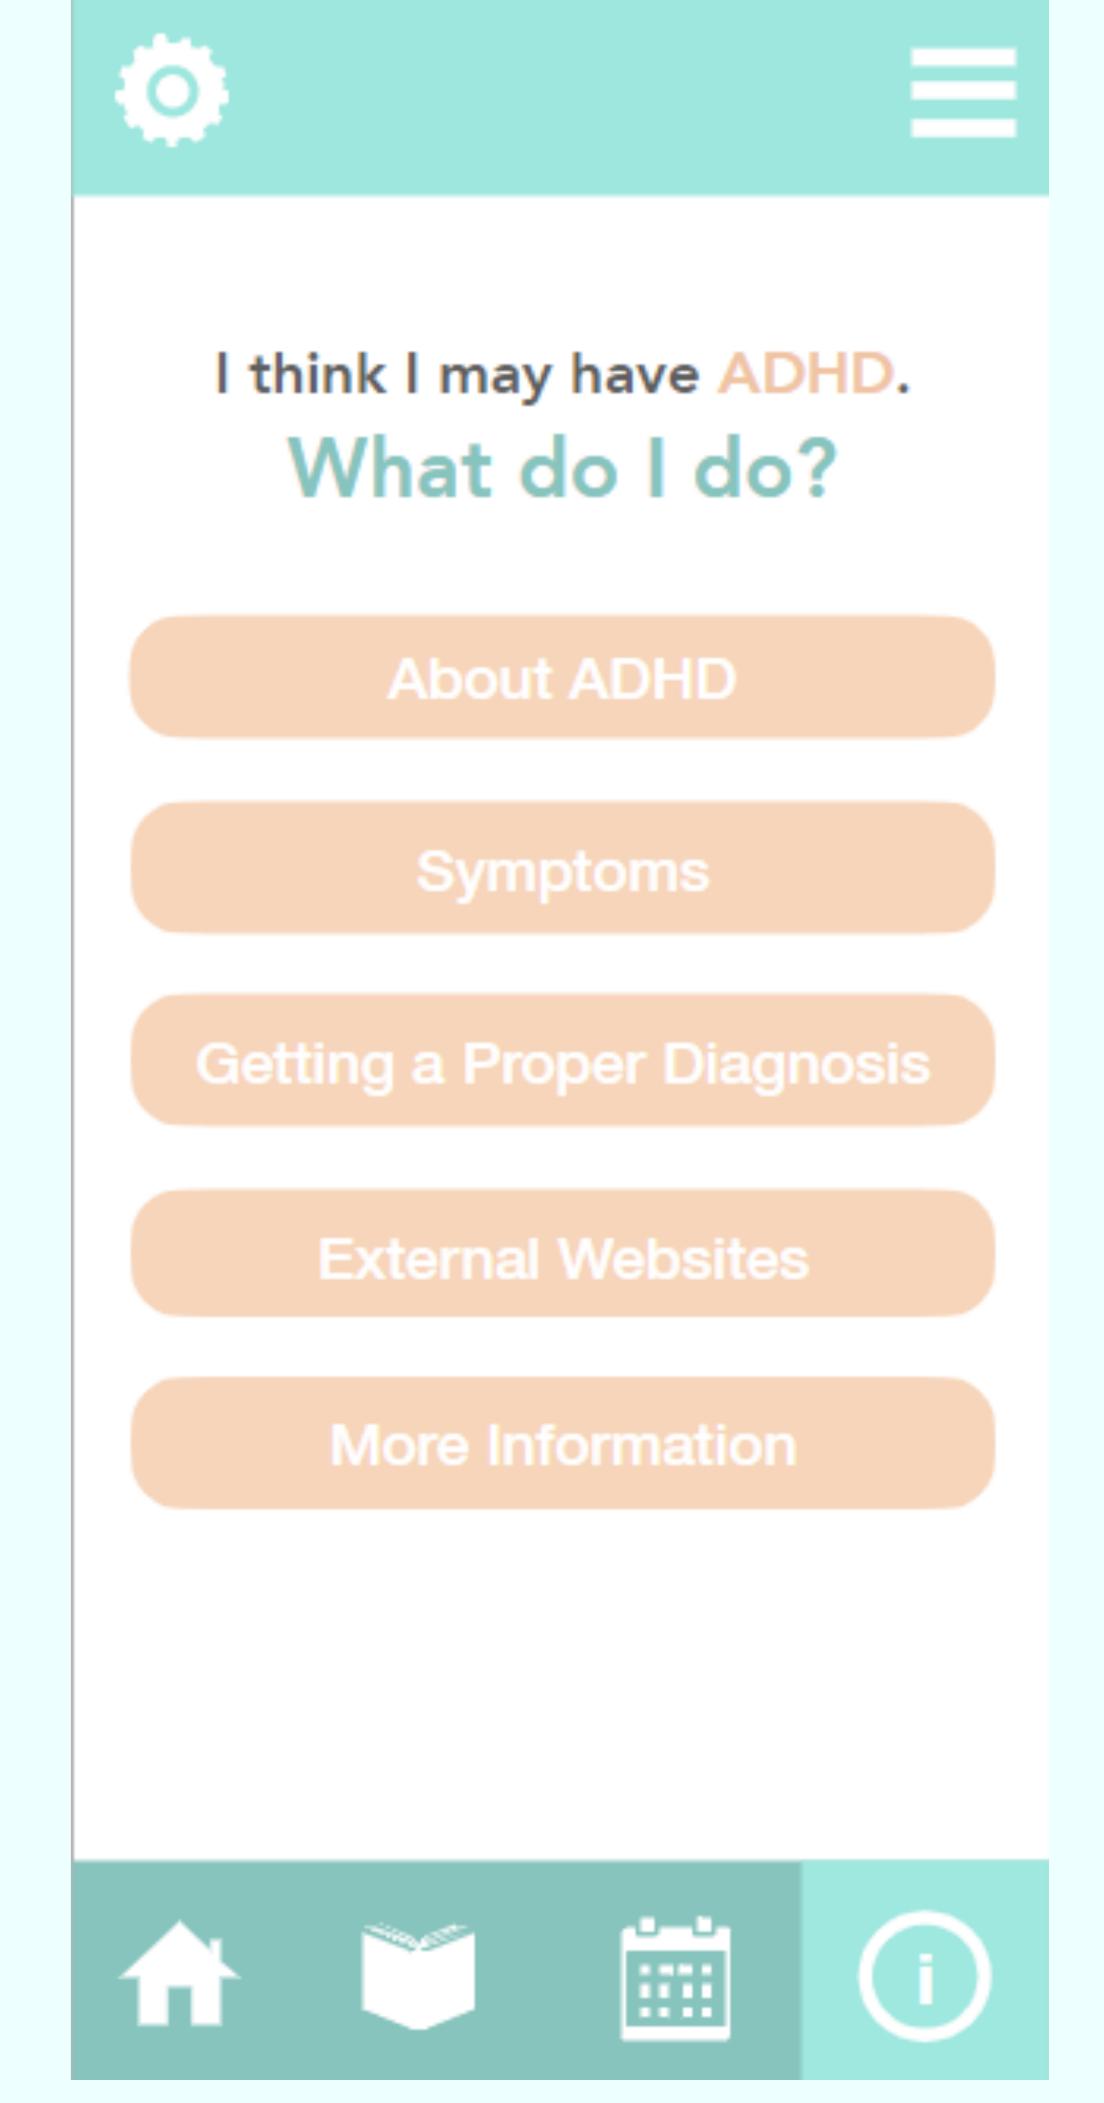

The home screen - the main page of the app! Users can access all statistics here.

The lesson library - where users can find lessons and learn in a fun and engaging way!

The focus tracker - presented in a calendar format that tracks how long a user has focused for each day.

The information screen - where the user can receive more information about ADHD as well as where and when to treat it.
